

One Nation One App

MINOR PROJECT REPORT

**Submitted in partial fulfillment of the requirement for the Degree of
Bachelors of Engineering in Computer Science & Engineering**

**Submitted To:
PARUL UNIVERSITY, VADODARA, GUJARAT (INDIA)**

Submitted By:
Sunil S buddh - 2403051057077
Karn Ayush - 2303051050351
Singh Suhani - 2303051051248
Abhayraj bhaduriya - 2303051051085

**Under The Guidance of:
Mr.Mohammad Asif (Faculty,
Department of CSE)**

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

PARUL INSTITUTE OF TECHNOLOGY VADODARA, GUJARAT

SESSION: AY 2025-2026

Parul University Parul Institute of Technology

(Session: 2025 -2026)

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

CERTIFICATE

This is to certify that _____ Students of **CSE VI Semester** of “ **Parul Institute of Technology, Vadodara**” has completed their **Minor Project** titled “**ONE NATION ONE APP**”, as per the syllabus and has submitted a satisfactory report on this project as a partial fulfillment towards the award of degree of **Bachelor of Technology in Computer Science and Engineering** under Parul University, Vadodara, Gujarat (India).

**Mr. Mohammad
asif (Project
Guide) Faculty,
CSE**

**Prof. Sumitra Menaria
Head (CSE)
PIT, Vadodara**

**DR. Swapnil Parikh
Principal
PIT, Vadodara**

DECLARATION

We the undersigned solemnly declare that the project report “**ONE NATION ONE APP**” is based on my own work carried out during the course of our study under the supervision of **Mr. Mohammad asif, Faculty ,CSE.**

We assert the statements made and conclusions drawn are the outcomes of my own work. I further certify that

1. The work contained in the report is original and has been done by us under the general supervision of our supervisor.
2. The work has not been submitted to any other Institution for any other degree / diploma / certificate in this university or any other University of India or abroad.
3. We have followed the guidelines provided by the university in writing the report.

Whenever we have used materials (data, theoretical analysis, and text) from other sources, we have given due credit to them in the text of the report and giving their details in the references.

Sunil S buddh - 2403051057077

Karn Ayush - 2303051050351

Singh Suhani - 2303051051248

Abhayraj bhaduriya - 2303051051085

ACKNOWLEDGEMENT

In this semester, we have completed our project on “One Nation One App”. During this time, all the group members collaboratively worked on the project and learnt about the industry standards that how projects are being developed in IT Companies. We also understood the importance of teamwork while creating a project and got to learn the new technologies on which we are going to work in near future.

We gratefully acknowledge for the assistance, cooperation guidance and clarification provided by “**Mr. Mohammad Asif**” during the development of our project. We would also like to thank our Head of Department **Prof. Sumitra Menaria** and our **Principal Dr. Swapnil Parikh** Sir for giving us an opportunity to develop this project. Their continuous motivation and guidance helped us overcome the different obstacles for completing the Project.

We perceive this as an opportunity and a big milestone in our career development. We will strive to use gained skills and knowledge in our best possible way and we will work to improve them.

Sunil S buddh - 2403051057077

Karn Ayush - 2303051050351

Singh Suhani - 2303051051248

Abhayraj bhaduriya - 2303051051085

ABSTRACT

One Nation One App is a web-based platform designed to provide multiple online services within a single unified application. In today's digital era, users rely on different applications for different services such as food ordering, ticket booking, hotel reservations, and online shopping. This creates inconvenience as users have to switch between multiple apps, manage multiple accounts, and remember different login credentials.

The proposed system aims to solve this problem by integrating all major online services into one platform. The application allows users to perform tasks such as booking movie tickets, reserving bus and train tickets, ordering food, booking hotels, and purchasing products through e-commerce, all within a single interface.

The platform includes user authentication, service modules, booking systems, and a centralized dashboard that enhances user experience. It is developed using modern web technologies such as HTML, CSS, JavaScript, Node.js, and MongoDB to ensure efficient performance and scalability. One Nation One App focuses on reducing complexity, saving time, and improving user convenience by providing a centralized solution for multiple digital services. This project contributes toward building a smarter and more integrated digital ecosystem.

CHAPTER 1 – INTRODUCTION

1.1 Overview

In today's fast-growing digital world, users depend on multiple applications to access different online services. For example, people use separate applications for booking movie tickets, ordering food, booking travel tickets, reserving hotels, and shopping online. This results in increased complexity, as users need to install multiple apps, manage different accounts, and switch between platforms frequently.

One Nation One App is a unified platform designed to integrate multiple online services into a single application. The system aims to simplify user experience by providing all essential services such as food ordering, travel booking, e-commerce, and entertainment booking in one place.

The platform allows users to access various services through a centralized interface. Users can log in once and perform multiple tasks without switching between different applications. This reduces effort, saves time, and enhances convenience.

The system is developed using modern web technologies including HTML, CSS, JavaScript, Node.js, and MongoDB. These technologies ensure smooth performance, scalability, and secure data handling.

Overall, One Nation One App aims to create a comprehensive digital solution that combines multiple services into a single efficient platform.

1.2 Problem Statement

In the current digital ecosystem, users rely on multiple applications to access different online services. For example, users need separate apps for food delivery, travel booking, movie tickets, hotel reservations, and online shopping. This leads to several challenges.

Firstly, managing multiple applications increases complexity for users. Each app requires separate installation, login credentials, and navigation, which makes the process time-consuming and inconvenient.

Secondly, switching between different platforms creates a fragmented user experience. Users often face difficulties in comparing services, managing bookings, and tracking orders across multiple applications.

Additionally, many applications consume device storage and system resources, which can affect device performance, especially in low-end smartphones.

Therefore, there is a need for a unified platform that integrates multiple services into a single application. Such a system can reduce complexity, improve efficiency, and provide a seamless user experience. The One Nation One App project is designed to address these challenges by offering all essential services in one place.

1.3 Objective of the Project

You can keep this section as **bullet points** (teachers prefer this).

Writing

The main objectives of the One Nation One App project are:

1. To develop a unified platform that integrates multiple online services in a single application.
2. To reduce the need for multiple applications by providing all services in one place.
3. To simplify user experience by offering a centralized dashboard.
4. To enable users to perform activities such as booking tickets, ordering food, and shopping online efficiently.
5. To design a user-friendly interface that ensures easy navigation and accessibility.
6. To build a secure system for managing user data and transactions.
7. To improve efficiency and save time by reducing app switching.
8. To create a scalable platform that can support future enhancements and additional services.

1.4 Applications / Scope of the Project

The One Nation One App platform has a wide range of applications in daily life. It can be used by individuals to access multiple online services such as booking travel tickets, ordering food, shopping online, and reserving hotels through a single application.

The system is useful for students, working professionals, travelers, and general users who frequently use online services. It reduces the need to install and manage multiple applications, thereby improving convenience and efficiency.

The platform can be implemented in various sectors including transportation, hospitality, e-commerce, and entertainment. It can also be expanded to include additional services such as digital payments, bill payments, and government services.

In the future, the scope of the system can be extended by integrating advanced technologies such as artificial intelligence for personalized recommendations, real-time tracking systems, and mobile application support.

Overall, the One Nation One App project has the potential to transform the way users interact with digital services by providing a centralized and efficient solution.

In the future, the scope of the system can be expanded by integrating advanced technologies such as mobile applications, real-time inventory updates, and location-based services. Additional features like AI-based product scanning and automated inventory management could further enhance the efficiency of the platform.

Overall, the Unified project has the potential to improve the connection between customers and local retailers while promoting a smarter and more efficient retail ecosystem.

1.5 Organization of the Report

This report is organized into several chapters that describe the design and development of the One Nation One App system.

Chapter 1 introduces the project and provides an overview, problem statement, objectives, and scope of the system.

Chapter 2 presents the literature survey that reviews existing systems such as e-commerce platforms, food delivery applications, and travel booking systems.

Chapter 3 describes the methodology used to design and implement the system, including system architecture, modules, and database design.

Chapter 4 explains the system requirements, including software tools and hardware specifications required for development and execution.

Chapter 5 presents the expected outcomes along with graphical user interface (GUI) designs that demonstrate the working of the system.

Finally, **Chapter 6** provides the conclusion of the project and discusses future scope and enhancements.

CHAPTER 2 – LITERATURE SURVEY

2.1 Introduction

A literature survey is an important step in understanding existing systems and technologies related to a project. It helps in analyzing previously developed solutions, identifying their strengths and weaknesses, and designing improved systems based on those insights.

In the domain of digital services, various platforms have been developed to provide online solutions such as food delivery, ticket booking, hotel reservations, and e-commerce services. These platforms have significantly improved user convenience and accessibility.

However, most of these systems operate independently and focus on a specific service. Users still need to rely on multiple applications to access different services, which creates complexity and inefficiency.

The One Nation One App system is designed to overcome these limitations by integrating multiple services into a single platform. This literature survey reviews existing systems and highlights the need for a unified application.

2.2 Review of Existing Systems

1. E-commerce Platforms

E-commerce platforms such as Amazon and Flipkart allow users to purchase products online. These platforms provide a wide range of products, secure payment options, and home delivery services.

Although these platforms are highly efficient for online shopping, they are limited to e-commerce services only. Users still need separate applications for other services such as food delivery or ticket booking.

2. Food Delivery Applications

Applications such as Zomato and Swiggy allow users to order food from nearby restaurants. These platforms provide features like menu browsing, online payment, and real-time delivery tracking.

However, these applications are focused only on food services and do not provide other functionalities such as travel booking or shopping.

3. Travel and Ticket Booking Systems

Platforms like IRCTC and MakeMyTrip are used for booking train tickets, bus tickets, flight tickets, and hotel reservations. These systems provide convenience for travel-related services.

Despite their usefulness, these platforms are limited to travel services and do not integrate other services such as food ordering or e-commerce.

4. Movie Ticket Booking Platforms

Applications such as BookMyShow allow users to book movie tickets and event tickets online. They provide seat selection, show timings, and secure payment options.

However, these platforms focus only on entertainment services and do not provide a complete solution for other daily needs.

Overall, existing systems are designed for specific purposes and do not provide a unified platform for multiple services.

2.3 Limitations of Existing Systems

Although existing platforms provide efficient services in their respective domains, they have several limitations when considered collectively.

One major limitation is the need to use multiple applications for different services. Users must install, manage, and switch between various apps, which increases complexity and reduces convenience.

Another limitation is the lack of integration between services. For example, users cannot easily combine travel booking, food ordering, and shopping within a single platform.

Additionally, managing multiple accounts and login credentials across different applications can be difficult and time-consuming.

These applications also consume device storage and system resources, especially on smartphones with limited capacity.

Furthermore, users may face difficulties in tracking orders and bookings across different platforms, leading to a fragmented experience.

These limitations highlight the need for a unified system that integrates all major services into a single platform.

2.4 Summary

The literature survey shows that although various digital platforms exist for e-commerce, food delivery, travel booking, and entertainment services, they operate independently and lack

ONE NATION ONE APP integration.

Each platform provides specialized services but fails to offer a complete solution for users who require multiple services on a daily basis. This results in increased complexity and inefficiency.

The One Nation One App system aims to address these issues by providing a unified platform that integrates multiple services into a single application. This approach improves user convenience, reduces the need for multiple apps, and enhances the overall user experience.

CHAPTER 3 – METHODOLOGY

1.1 Introduction

The methodology section describes the design and development approach used to build the One Nation One App system. It explains how different components of the system interact with each other to provide multiple services through a single platform.

The system is designed as a web-based application where users can access various services such as booking tickets, ordering food, shopping online, and reserving hotels through a centralized interface.

The development follows a structured approach where the frontend, backend, and database work together to process user requests efficiently. The frontend provides the user interface, the backend handles business logic and request processing, and the database stores all relevant data.

This architecture ensures smooth communication between different components and enables efficient service delivery.

1.2 System Architecture

The system architecture of the One Nation One App follows a client-server model where users interact with the platform through a web interface while the backend server processes requests and manages data communication.

In this architecture, the client side consists of a web interface developed using HTML, CSS, and JavaScript. Users interact with the system through this interface to access different services such as food ordering, travel booking, and ticket reservations.

The backend server is designed using Node.js and is responsible for handling user requests, processing service selections, and managing communication between different modules. The server receives requests from the client interface and processes them through predefined API routes.

The database layer is used to store important information such as user details, service categories, and booking data. MongoDB is used as the database management system due to its flexibility and ability to efficiently manage large amounts of data.

Through this architecture, the system ensures smooth communication between the frontend and backend, enabling users to access multiple services in a unified platform.

1.3 Proposed Methodology

The proposed methodology of the One Nation One App system focuses on providing a unified platform where users can access multiple services from a single application.

The workflow begins when a user accesses the platform and selects a service such as food ordering, ticket booking, or travel. Once the user selects a service, the request is

ONE NATION ONE APP

sent to the backend server.

The backend processes the request and, in future implementations, will communicate with external service APIs to fetch relevant data. The processed information is then sent back to the user interface where the user can view available options and proceed with the desired action.

The system is designed to ensure convenience and efficiency by reducing the need for multiple applications. Each service is treated as a separate module, allowing easy expansion and integration of new services in the future.

1.4 System Modules

The One Nation One App platform is divided into multiple functional modules that work together to provide complete system functionality. The User Authentication module allows users to register and log into the system securely.

It ensures that only authorized users can access personalized features. The Service Selection module enables users to choose different services such as food delivery, travel booking, and ticket reservations from a single interface.

The Service Integration module is responsible for connecting different services within the platform. In future, this module will integrate external APIs for real-time data and functionality. The Navigation module manages user interaction within the application and ensures smooth movement between different sections of the platform.

The Admin module provides control over the system, allowing administrators to monitor activities, manage users, and maintain system performance.

By organizing the system into these modules, the platform ensures structured development and efficient functionality.

1.5 Database Design

The database design of the One Nation One App is structured to manage and store data related to users, services, and transactions effectively. MongoDB is selected as the database management system due to its flexibility and scalability.

The User entity contains information about registered users including name, email, password, and preferences, which helps in managing user accounts.

The Service entity stores details about the different services available on the platform such as food, travel, and booking categories.

The Booking entity records transaction-related data including orders, reservations, and user activity history.

The Provider entity maintains information about various service providers that are connected to the platform.

The relationships among these entities help in quick data retrieval and ensure that users can access multiple services efficiently through a single system.

CHAPTER 4 – SYSTEM REQUIREMENTS

The System Requirements chapter describes the hardware and software specifications required to develop and run the **One Nation One App**. These requirements ensure that the system functions efficiently and provides a smooth experience for users, sellers, and administrators. Proper system requirements help maintain performance, reliability, and scalability of the application.

One Nation One App is a web-based platform designed to help customers find nearby shops where a specific product is available. The system connects customers and sellers digitally while allowing shop owners to update product availability and shop details in real time.

To successfully develop and deploy this system, certain software tools, programming technologies, and hardware configurations are necessary.

4.1 Software Requirements

Software requirements include the tools and technologies used to design, develop, and run the One Nation One App system.

Operating System

The system can be developed and executed on modern operating systems such as:

- Windows 10 or above
- Linux (Ubuntu or similar distributions)
- macOS

Frontend Technologies

The frontend is responsible for the user interface of the application.

HTML (HyperText Markup Language)

Used to structure the web pages of the application.

CSS (Cascading Style Sheets)

Used to design and style the interface, improving user experience.

JavaScript

Used to add dynamic functionality such as user interaction, form validation, and real-time updates.

Node.js

Used as a runtime environment for executing server-side code.

Express.js

A framework used to build APIs, handle requests, and manage routes.

Database

MongoDB

A NoSQL database used to store user data, bookings, products, and transactions.

Development Tools

Visual Studio Code (VS Code)

Used for writing and managing code.

Git and GitHub

Used for version control and project management.

Postman

Used for testing APIs.

Web Browsers

Google Chrome, Mozilla Firefox, and Microsoft Edge are used for testing the application.

Additional Libraries

Authentication libraries, payment integration libraries, and data validation tools are used to enhance system functionality..

4.2 Hardware Requirements

Hardware requirements refer to the physical devices required for development and usage of the system.

Development Hardware Requirements

Processor

- Intel Core i3 or higher
- AMD Ryzen equivalent

Memory (RAM)

- Minimum: 4 GB
- Recommended: 8 GB

Storage

- Minimum: 20 GB available space

Internet Connection

A stable internet connection is required for development, testing, and deployment.

End User Requirements

Smartphones

Users can access the system using mobile browsers.

Laptops / Desktops

Used for accessing advanced features and admin operations.

Network Requirements

The system uses HTTP and HTTPS protocols for secure communication between client and server.

Summary

These requirements ensure smooth development, efficient performance, and scalability of the One Nation One App system.

CHAPTER 5 – EXPECTED OUTCOMES (WITH GUI)

This chapter presents the graphical user interface (GUI) of the **Unified platform**. The graphical interface demonstrates how users interact with the system to explore nearby shops, understand the workflow of the platform, and connect with local sellers.

The Unified system is designed with a simple and user-friendly interface to ensure that both customers and shop owners can easily navigate the platform. The following sections present the major interface screens of the system.

5.1 Landing Page

Figure 5.1: One nation One app Landing Page

The landing page of the One Nation One App platform is the first interface that users see when they open the application. It provides a clear overview of the platform and highlights its main purpose, which is to integrate multiple services into a single application.

The landing page includes the following components:

- **A clean and modern user interface with a central heading introducing the platform**
- **Service highlights showing features like booking, ordering, and shopping**
- **Navigation options for accessing different sections of the application**
- **Login and Signup buttons for user authentication**

The design focuses on simplicity and clarity so that users can quickly understand the purpose of the platform and proceed further.

5.2 Login Page

Figure 5.2: User Login Interface

The screenshot displays the user login interface for the ONE NATION ONE APP. At the top, a navigation bar includes the app logo, the text 'ONE NATION ONE APP', and links for 'Events', 'Movies', 'Flights', 'Trains', and 'Buses'. On the right side of the navigation bar are icons for a heart, a bell, and a 'Sign In' button. The main content area features a central white card with a light gray border. The card is titled 'Welcome Back' and contains the instruction 'Sign in to your ONE NATION ONE APP account'. Below this, there are two input fields: 'Email address' with an envelope icon and 'Password' with a lock icon and a toggle eye icon. A prominent blue 'Sign In' button is positioned below the input fields. At the bottom of the card, there is a link that reads 'Don't have an account? Sign up'.

The login page allows registered users to securely access the One Nation One App system. It ensures that only authorized users can use the services provided by the platform.

The login interface includes:

- Email or Username input field
- Password input field
- Login button
- Option for new users to navigate to the signup page

After successful login, users are redirected to the main dashboard where all services are available. The login system ensures secure access and protects user data.

Figure 5.3: User Registration Page

The screenshot displays the 'Create Account' page of the 'ONE NATION ONE APP'. The header features the app's logo on the left, navigation links for 'Events', 'Movies', 'Flights', 'Trains', and 'Buses' in the center, and a heart icon, a bell icon, and a 'Sign In' button on the right. The main content area is a light gray rectangle containing a white card. The card is titled 'Create Account' in bold black text, followed by the subtitle 'Sign up to save your wishlists and bookings'. Below this, there are two input fields: 'Email address' with an envelope icon and 'Password' with a lock icon and a toggle eye icon. A prominent blue 'Create Account' button is positioned below the input fields. At the bottom of the card, there is a link that reads 'Already have an account? Sign in'.

The signup page is used for new user registration. It allows users to create an account and become part of the platform.

Users are required to provide:

- Full Name
- Email Address
- Password
- Contact details

Once registration is completed, the user can log in and access all available services. This ensures that all users are verified and authenticated before using the platform.

5.4 dashboard

Figure 5.4: Listing of all events

The dashboard is the core interface of the One Nation One App system. It acts as a central hub where all services are displayed in a structured and user-friendly manner.

The dashboard includes multiple service options such as:

- **Movie Booking**
- **Travel Booking (Bus, Train, Flight)**
- **Hotel Booking**
- **Food Ordering**
- **E-commerce Shopping**

Each service is presented as a card or section, allowing users to easily select and access it. The dashboard reduces the need for multiple applications by providing everything in one place. This interface ensures smooth navigation and improves overall user experience.

The service pages allow users to interact with specific functionalities of the platform.

Movie Booking Page

Users can browse available movies, select show timings, and book tickets.

Travel Booking Page

Users can search for buses, trains, or flights and complete ticket booking.

Hotel Booking Page

Users can view available hotels, compare prices, and make reservations.

Food Ordering Page

Users can browse restaurants, view menus, and place food orders.

E-commerce Page

Users can explore products, add them to the cart, and purchase them online.

Each service page is designed to be simple, responsive, and easy to use, ensuring that users can complete their tasks efficiently.

5.5 Explore Nearby Shops Page

Figure 5.5: E

Summary

The graphical user interface of the One Nation One App system is designed to provide a simple and integrated experience for users. The platform allows access to multiple services through a single interface, reducing complexity and improving efficiency.

ONE NATION ONE APP

The design ensures that users can easily navigate between different services without confusion. By combining multiple functionalities into one platform, the system provides a seamless and user-friendly experience.

Overall, the GUI demonstrates how the system successfully integrates different services into a unified application.

CHAPTER 6 - CONCLUSION & FUTURE SCOPE

6.1 Conclusion

The One Nation One App system is developed as a unified platform that integrates multiple online services into a single application. In the current digital environment, users rely on different applications for different services, which leads to complexity and inefficiency.

This project successfully addresses this problem by providing a centralized platform where users can access services such as food ordering, travel booking, movie ticket booking, hotel reservations, and online shopping.

The system improves user convenience by reducing the need to switch between multiple applications. It also enhances efficiency by providing all services under a single interface.

The use of modern technologies ensures that the system is scalable, secure, and efficient. The project demonstrates how integration of multiple services can simplify digital interactions and improve user experience.

Overall, One Nation One App provides a practical and innovative solution for managing multiple online services in a unified way.

6.2 Future Scope

The One Nation One App system provides a strong foundation for integrating multiple digital services into a single platform. However, there are several opportunities for future enhancement and expansion.

One of the major improvements can be the development of a dedicated mobile application. While the current system is web-based, a mobile app can provide better accessibility, faster performance, and a more user-friendly experience. Features such as push notifications can be added to inform users about booking updates, offers, and order status.

Another important enhancement is the integration of Artificial Intelligence (AI) for personalized recommendations. The system can analyze user behavior and suggest relevant products, services, restaurants, or travel options based on user preferences.

The platform can also include real-time tracking features for food delivery, travel bookings, and order status. This will improve transparency and user satisfaction.

ONE NATION ONE APP

Voice-based search and booking functionality can be introduced to make the system more accessible, especially for users who are not comfortable with typing or navigating complex interfaces.

Future versions can integrate advanced payment systems such as UPI, digital wallets, and secure multi-factor authentication to enhance transaction security.

The addition of a chatbot or live chat support system can help users resolve queries instantly and improve customer support.

The system can also be expanded to include additional services such as bill payments, healthcare appointment booking, and government services, making it a complete digital ecosystem.

Finally, the platform can be scaled to support a larger user base across different regions, making it suitable for nationwide usage. With continuous improvements and integration of new technologies, One Nation One App has the potential to become a powerful and comprehensive solution for everyday digital needs.
